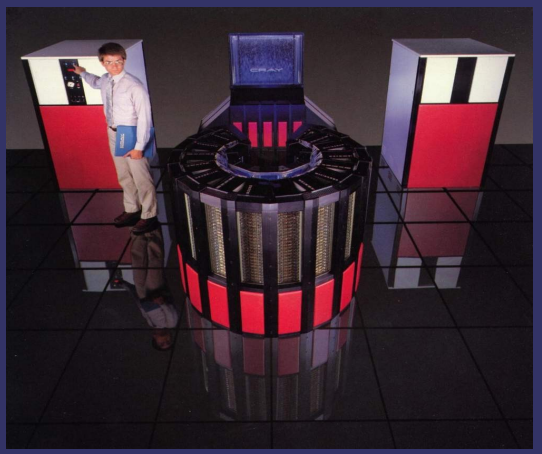
When the virtual bleeds into the physical: a music perspective for the future of human computer interaction

George Tzanetakis
Associate Professor
Computer Science (also ECE and Music)
University of Victoria

Canada Tier II Research Chair in
Computer Analysis of Audio and Music

Human Computer Interaction

Despite the breathtaking progress of computing technology (iPad tied with Cray-2, 1985 – 17 million), HCI is very limited compared to HHI



Two fundamental problems

- Lack of shared understanding
- Communication bottleneck:
  - Input: Mouse/keyboard (touch screen)
  - Output: Rectangular 2D screen, spe

Why Music ?

- The way music is created, distributed, and perceived has been and will be transformed by advances in technology
- Throughout history and throughout the world humans have been making music
- Arguably the most complex and expressive interaction with artifacts

Some examples from history

Overview

Digital Music Data

2000: Content-analysis based on Signal Processing and Machine Learning ~1000 tracks

2010: iTunes Genius, Google Music Instant Playlists, Pandora, Last.FM, Echonest, Spotify.... ~ 13 million tracks

The future: all of recorded music (48 hours uploaded to YouTube every minute)

Semantic Annotation/ Automatically Tagging Music

1) Given a music track automatically predict words that music listeners would use to describe it

2) Given a set of words describing music return a list of music tracks for which the words would be applicable

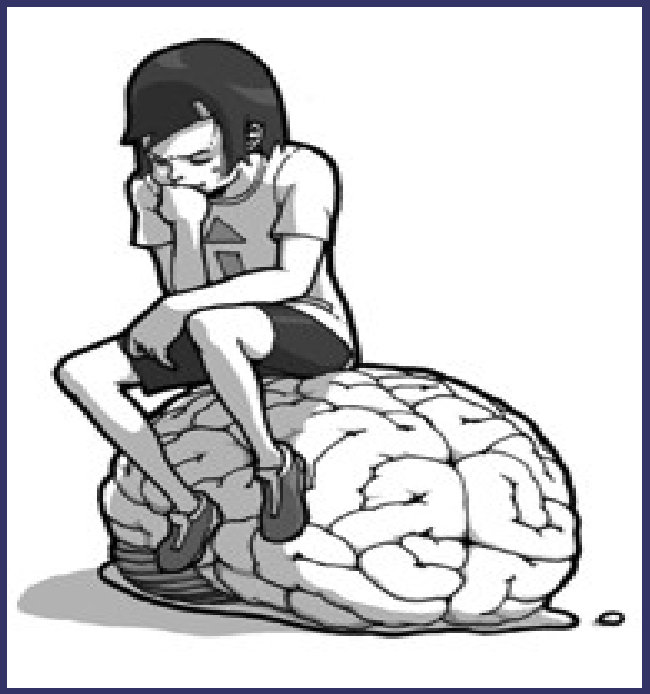
Embodied cognition

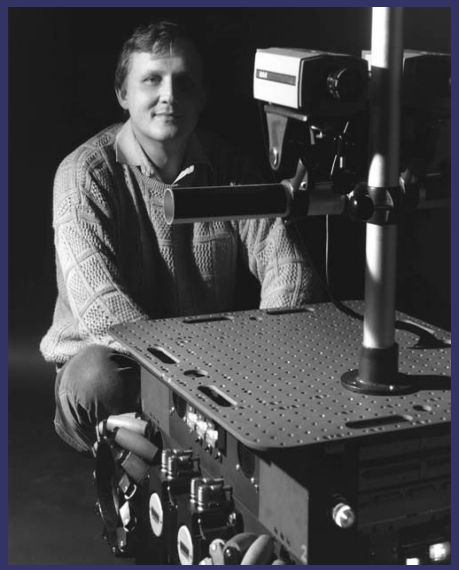


REPRESENATION and
Perception (BRAIN + ear)

ACTION and interaction
Body as mediator between
mind and environment (BODY)

Embodied Cognition in AI

Encoded in the large, highly evolved sensory and motor portions of the human brain is a billion years of experience about the nature of the world and how to survive in it. The deliberate process we call reasoning is, I believe, the thinnest veneer of human thought, effective only because it is supported by this much older and much powerful, though usually unconscious, sensorimotor knowledge. We are all prodigious olympians in perceptual and motor areas, so good that we make the difficult look easy. Abstract thought, though, is a new trick, perhaps less than 100 thousand years old. We have not yet mastered it. It is not all that intrinsically difficult; it just seems so when we do it – Moravec's paradox



Embodied musicianship

- Focus on tool building and using the idea of embodiment to guide the design/approach rather than trying to understand cognition
- Leveraging MIR techniques for audio signals not just symbolic
- Blending the physical and the virtual
- Digital Signal Processing, Machine Learning and Human-Computer Interaction

Music Information Robotics Proprioception

Music Information Robotics: coping strategies for musically challenged robots, S.. Ness, S. Trail, P. Driessen, G. Tzanetakis ISMIR 2011

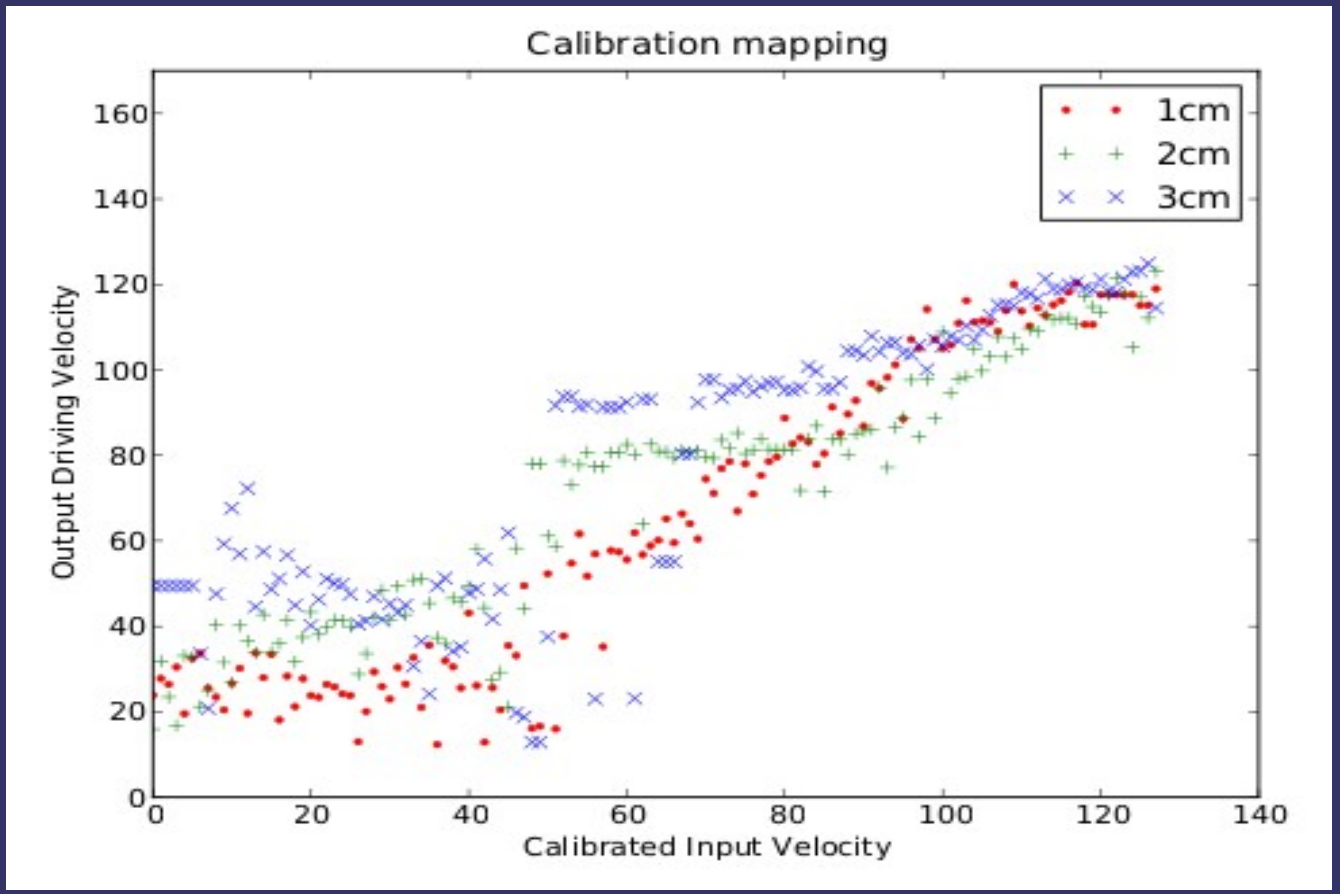
- The perception of your own body
- Automatic sound “check”
- Automatic mapping of modular percussion actuators using audio classification
- Automatic calibration/mapping to compensate for the differences in response of individual actuators to the same velocity/voltage

Modular drum classification (recognizing which drum you are banging)

Peak offset	Percent correct	Peak offset	Percent correct
0	66.38	4	90.52
1	91.95	5	86.49
2	91.67	6	86.49
3	91.95	7	77.59

4 different frame drums,
Classic audio feature extraction and SVM classification

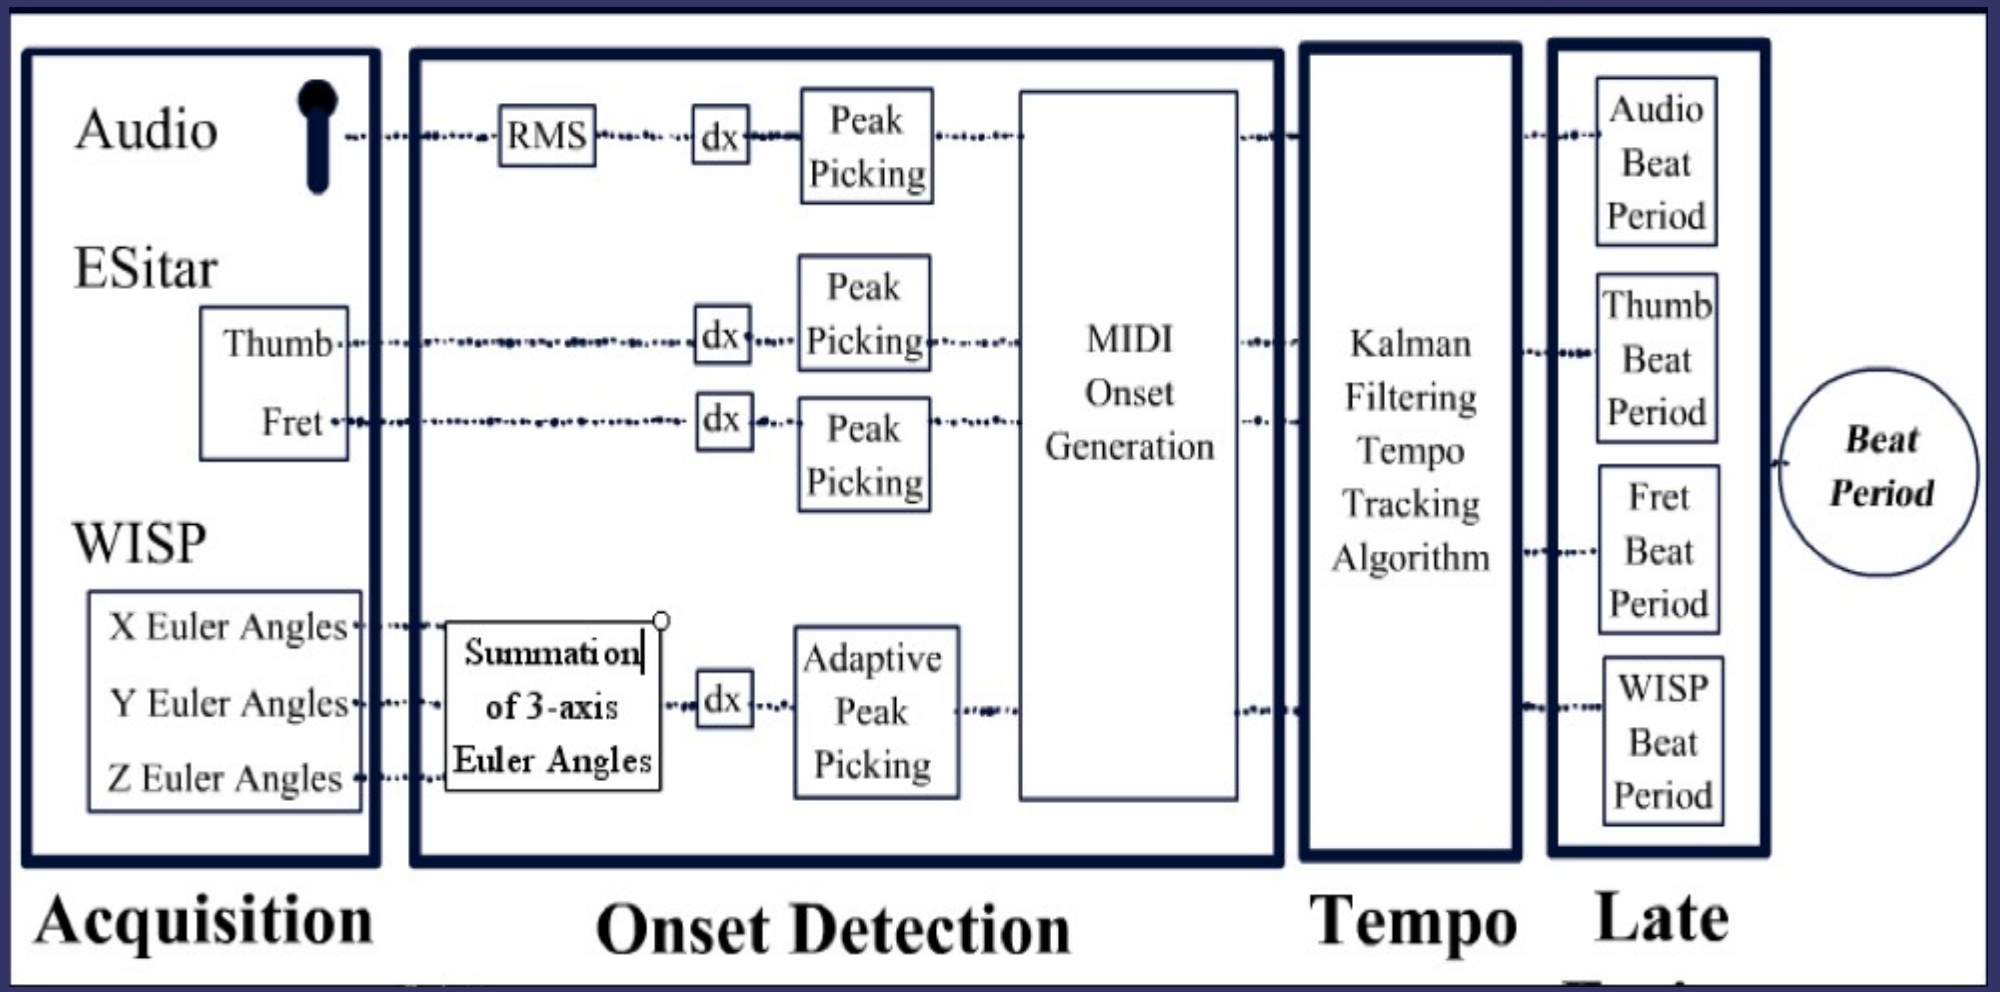
Calibration Map (adjusting how hard you play by how loud you sound)



Goal: uniform loudness, timbre for same input velocities independently of distance from drum

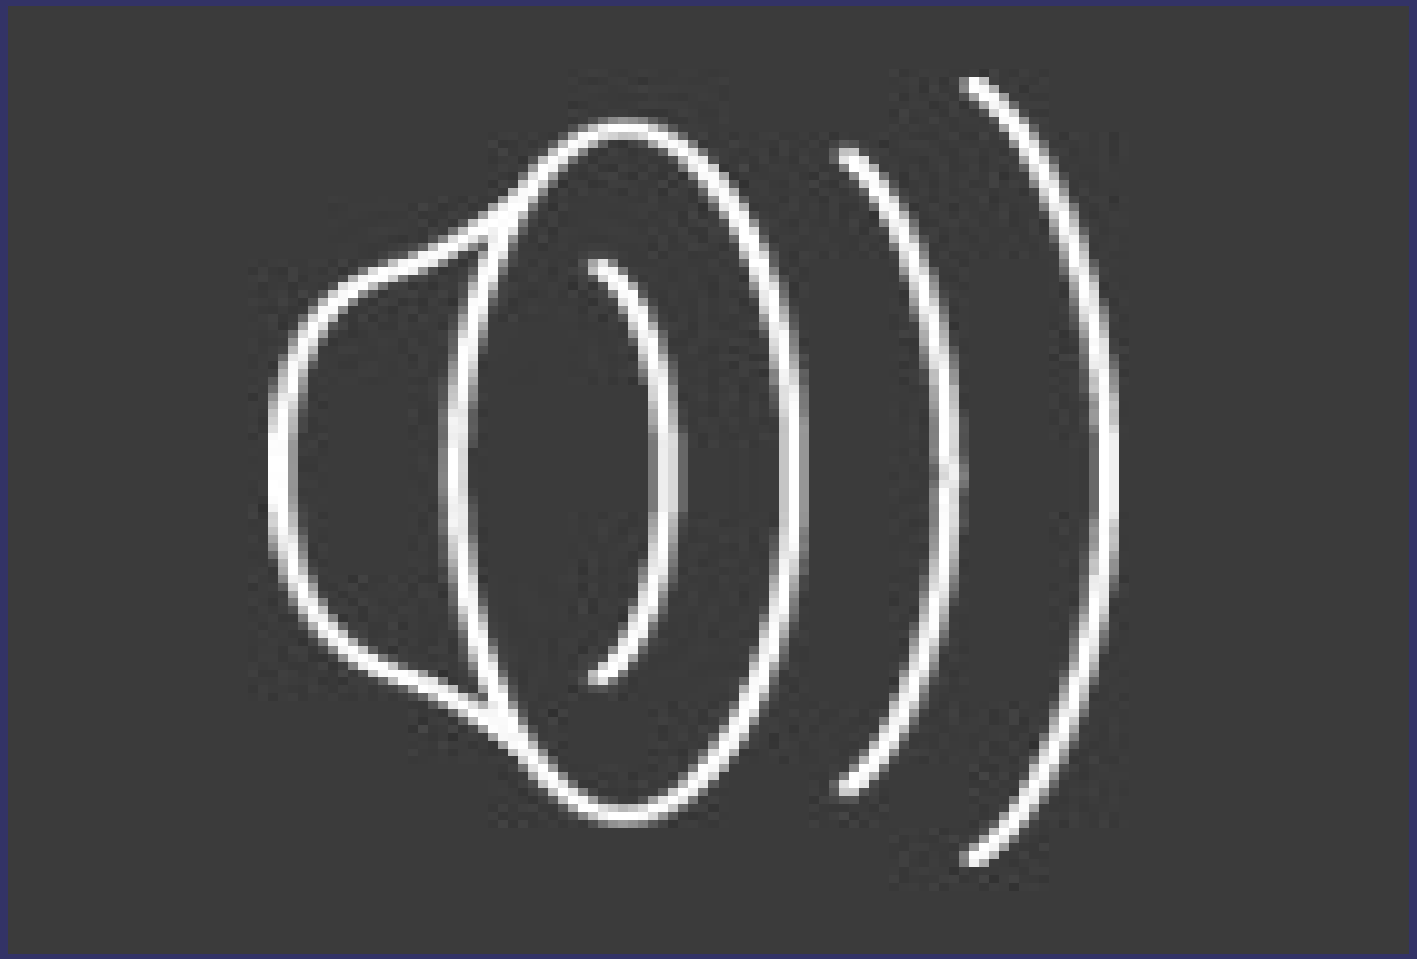
Currently done manually either in software or in the actual physical world

Real-time Multi-Modal Beat Tracking



Reacting to rhythm

Reacting to rhythm



Physical Modeling meets Machine Learning: Teaching a virtual violinist to bow

G. Percival, G. Tzanetakis, N. Bailey, Sound and Music Computing 2011

- Physical modeling provides expressive control with physical parameters such as bow force and velocity
- As in a real violin continuous control is tricky and requires feedback (audio and haptic)
- Main idea: “teach” rather than “program”

Physical Modeling

- No recordings of violin performance; we use physics [1]
  - Wave equation for a stiff string with modal dampening

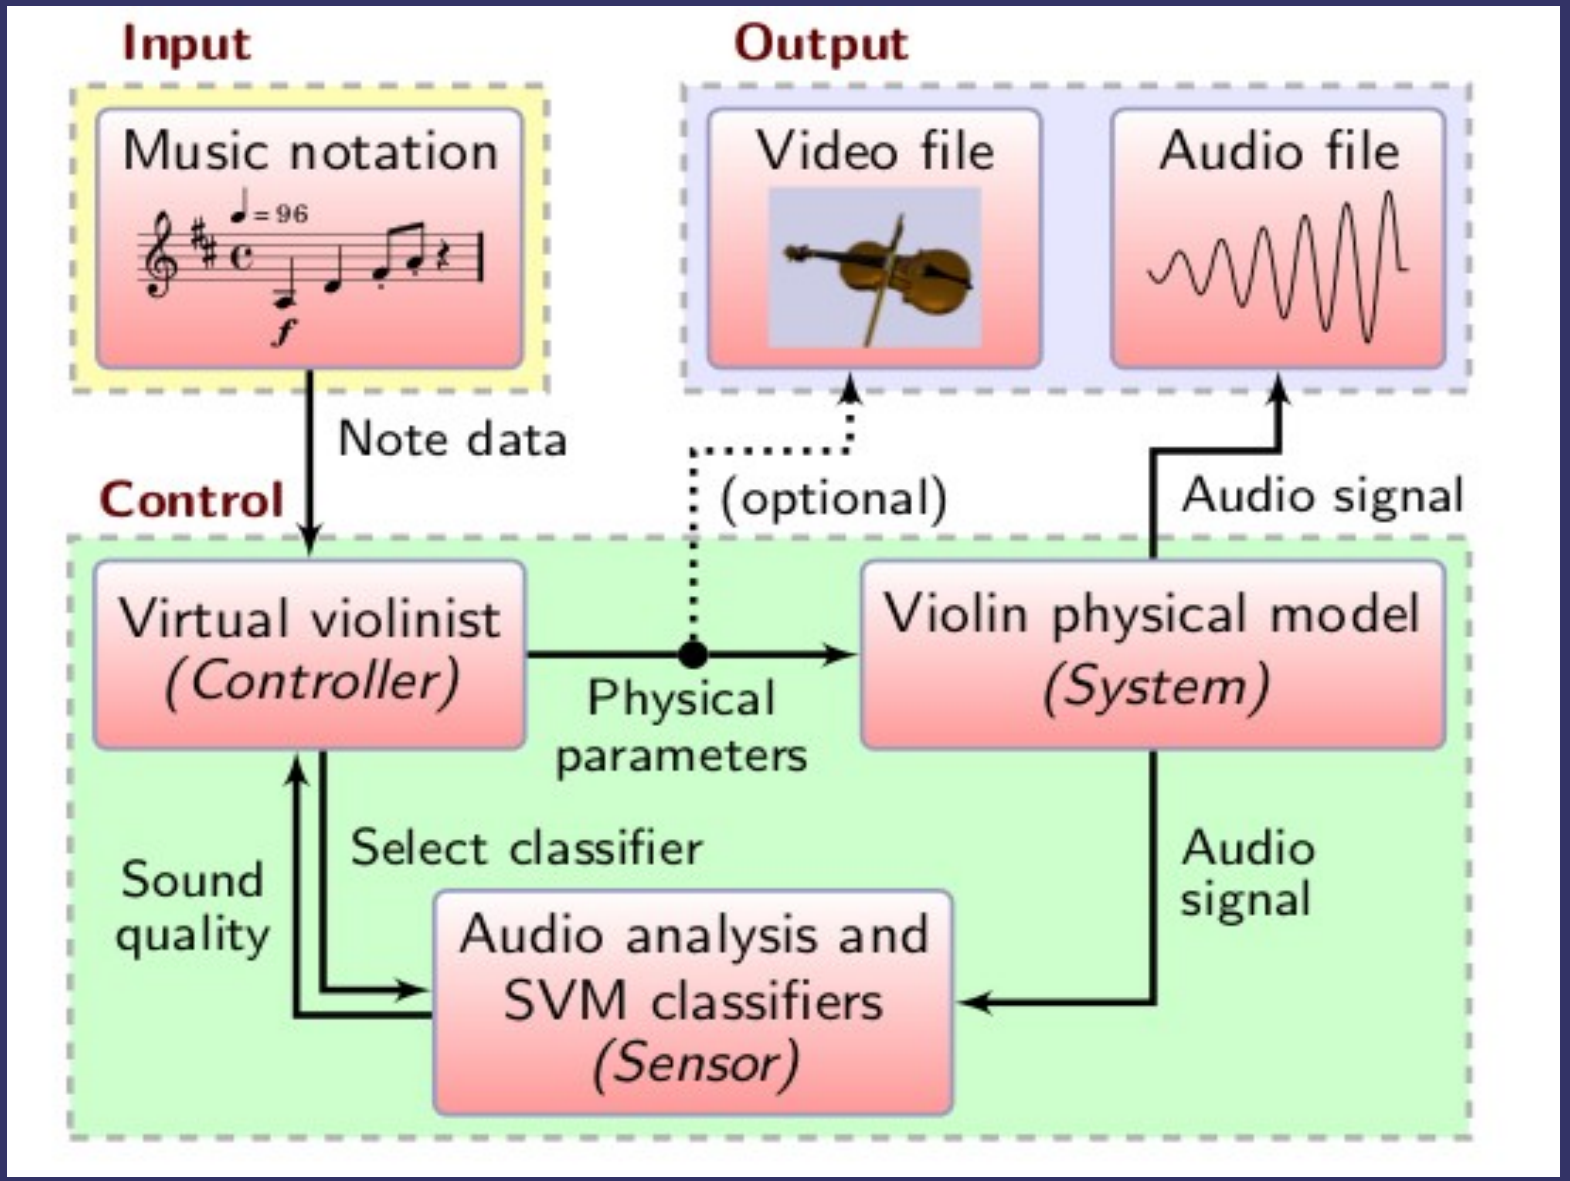
$$\rho_{\mathrm{L}} \frac{\partial^2 y(x,t)}{\partial t^2} - T \frac{\partial^2 y(x,t)}{\partial x^2} + EI \frac{\partial^4 y(x,t)}{\partial x^4} + R_L(\omega) \frac{\partial y(x,t)}{\partial t} = F(x,t)$$

- Implemented as a C++ library, published under GNU GPLv3+

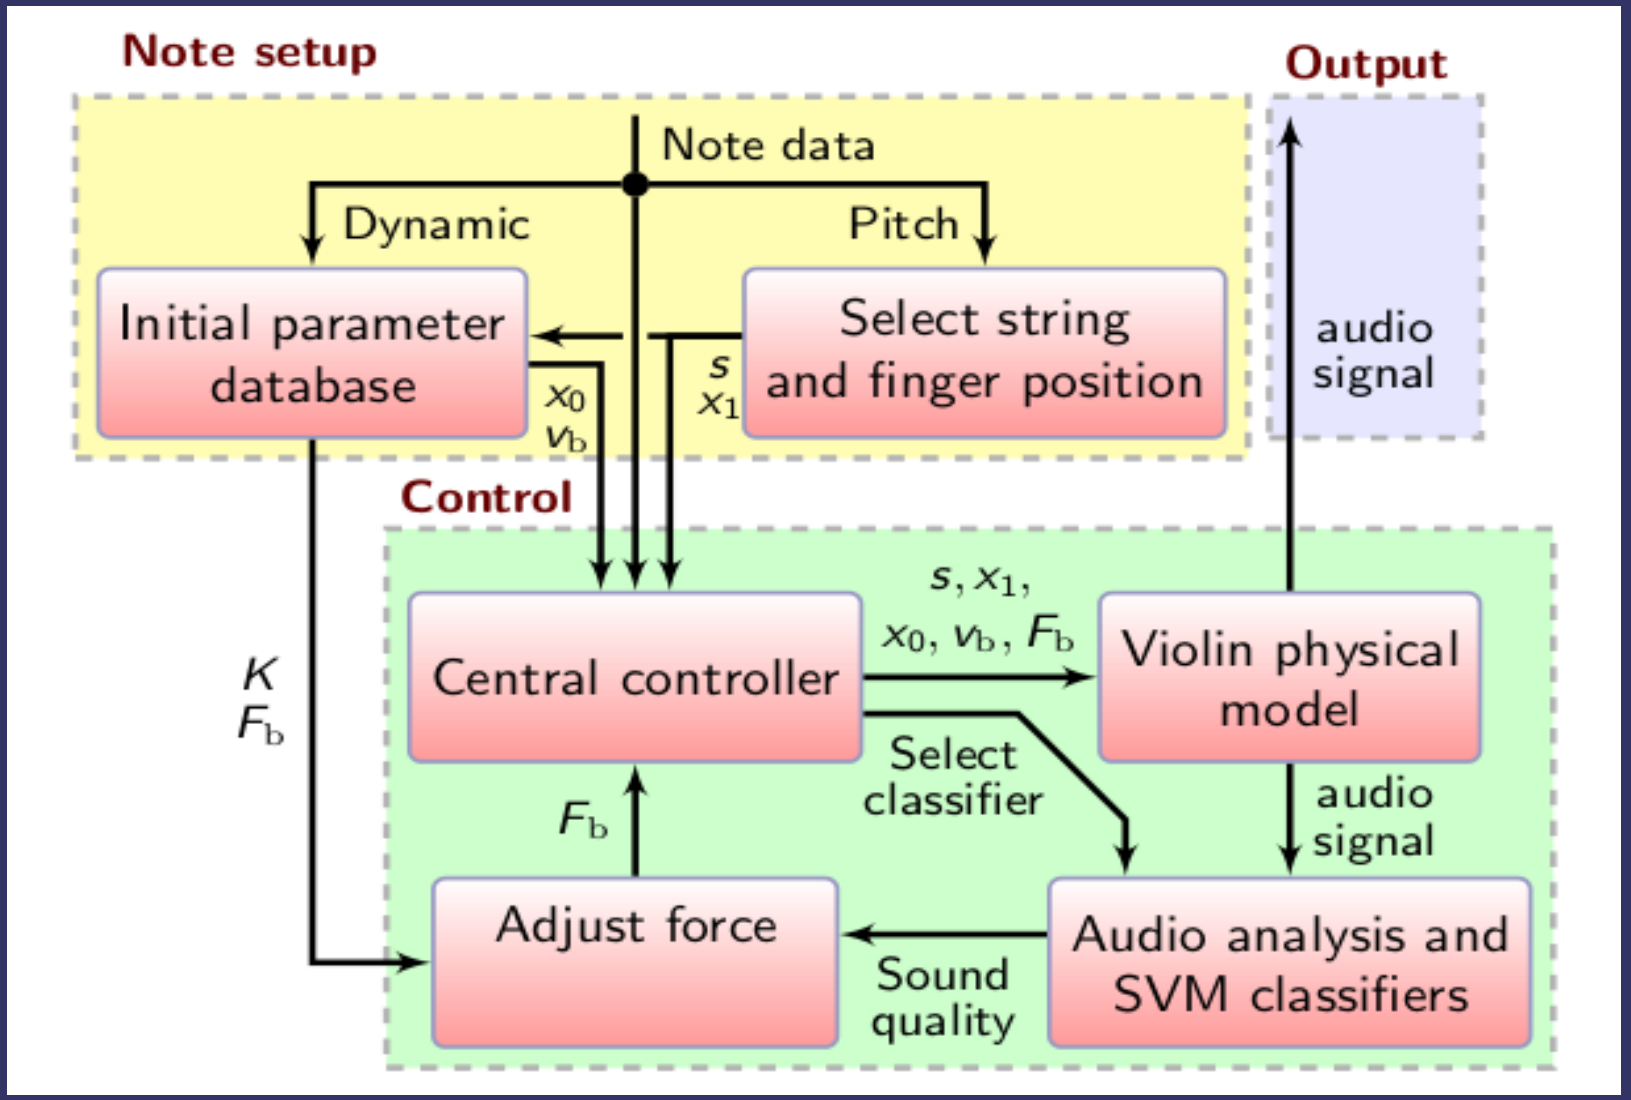
Input parameters

- Violin string number s
- Left-hand finger position x_1
- Bow-bridge distance x_0, velocity v_b, force F_{b}

System architecture



Feedback Loop



Supervised scale and exercise playing

- Before training

- After training

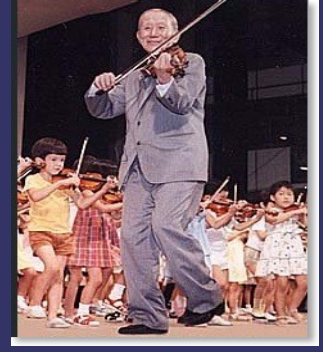
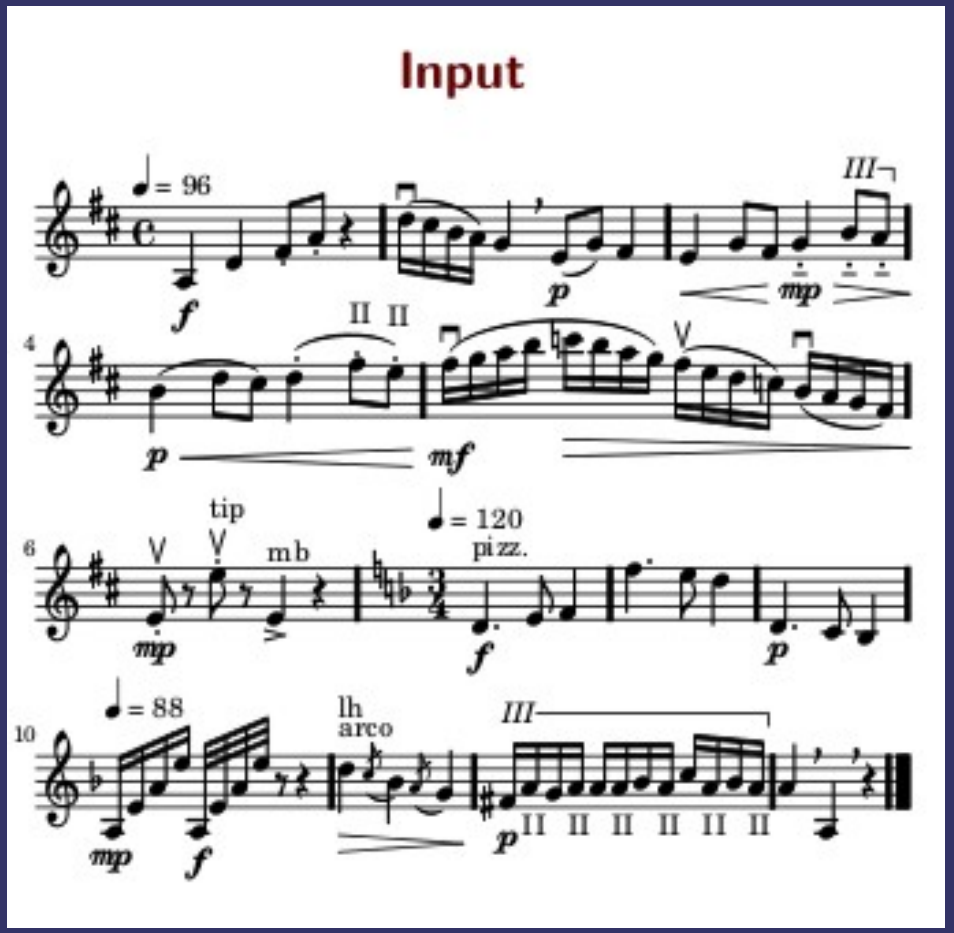
Playing a piece





Playing a piece

Summary

- The way music is created, distributed and perceived is changing dramatically
- Music provides a beautiful testbed for exploring radical ideas in Human Computer Interaction and blending the boundaries between the physical and virtual world
- Body (physical and virtual) as mediator between action and perception
